Your Personal Coating Solution

Birdhouses offer a safe haven, especially during the cold fall and winter months. Using a basic construction plan and pre-cut timber, we built birdhouses for installation in our company premises. To protect the little shelters, the roofs were sealed with remains from our latest production of roofing membranes.

Plants help to regulate the climate by absorbing and storing carbon dioxide from the atmosphere. They also provide a habitat and food for various animals species. Together with a member of the Caritas organization, we launched a planting campaign to green the company premises.

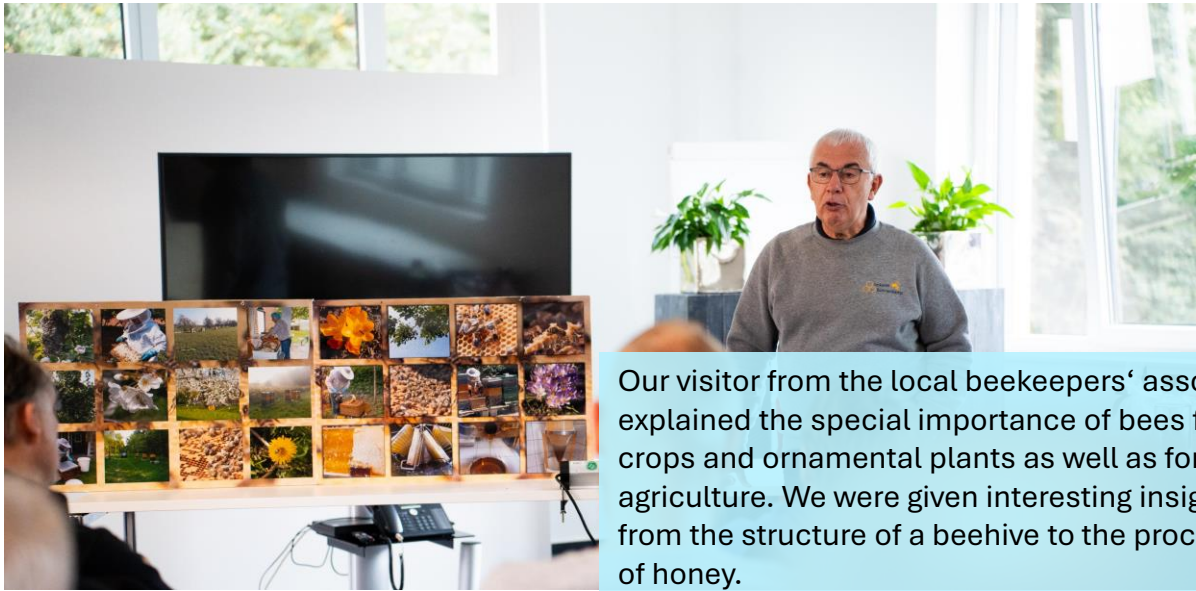

Waste can contain hazardous substances that pollute the soil and water and thus enter the food chain. Plastic waste can also be carried into the sea by the wind or rivers, threatening the global ecosystem. Our teams therefore took the time to collect waste on the company premises.

Food sharing brings people from different backgrounds together and encourages them to participate, think and use our planet's resources responsibly.

Two members of a food sharing organisation gave us ideas on how we can become food savers ourselves.

Our visitor from the local beekeepers' association explained the special importance of bees for crops and ornamental plants as well as for agriculture. We were given interesting insights, from the structure of a beehive to the processing of honey.

PLANET PASSIONATE

Recycling is a vital part of a sustainable lifestyle. It helps to reduce the ecological footprint and promote a circular economy in which materials are reused. Our upcycling team cut paper cores from pre- and waste material to smaller sizes, which we now use in our production.
